E Shapes when patching after 1st vs after 7th layer

We present qualitative comparison of sharpness of the shapes of $d(\alpha)$, obtained using the same methods as in Section 4, when we interpolate and patch after 1st (Figure 23) and after 7th (Figure 24) layer in `Qwen2-1.5B`. The y-axis is $d(\alpha)/d(1)$ in both figures. While smoother, results for layer 7 still show a significant jump around the middle of the interpolation.
